# Supplement to the Rutaceae in Peninsular Malaysia

B.C. STONE

Botanical Research Institute of Texas 509 Pecan Street, Fort Worth, TX 76102 USA

with account of *Melicope*by
T.G. HARTLEY

Australian National Herbarium, CSIRO Division of Plant Industry, P.O.Box 1600, Canberra, Australia 2601.

#### **Abstract**

Since the publication of the Rutaceae in the "Tree Flora of Malaya" (vol.1,1972), there have been a number of changes both bibliographic and taxonomic which ought to be accommodated in this account. The genus *Terminthodia* has been subsumed within *Tetractomia*; a new genus *Maclurodendron* has been established to include some species formerly placed in *Acronychia*; and *Tetradium* has been revived to hold certain species of *Euodia*. The remaining species of *Euodia* are now believed to be most correctly placed in *Melicope*. They are herein revised by T.G. Hartley. His account shows that *Melicope* is represented in Peninsular Malaysia by 10 species. Among these, *M. corneri* T. Hartley is proposed as a new species, *M. pahangensis* T.Hartley as a new name, and *M. pachyphylla* (King) T. Hartley and *M. macrocarpa* (King) T. Hartley as new combinations. In the Aurantioideae, there are now improved treatments of *Glycosmis* and *Citrus*, and the plant referred to as "Citrus sp. A" in the 1972 treatment was subsequently described as a new species, *C.halimii*. Some controversial matters such as the discrimination of certain genera and species are discussed herein. Finally the key to genera, which was imperfect, has been reworked and corrected. This account thus summarizes these details and presents, where useful, a new treatment to substitute for the old; it should be used in conjunction with the 1972 treatment. To facilitate use, the keys, generic, and specific accounts are set out here in the same form as in that volume.

#### ANNOTATED KEY TO GENERA OF MALAYAN RUTACEAE

(Based chiefly on vegetative characters)

1. 1.	Woody climbers, never trees or erect shrubs; stems with recurved or hooklike spines 2 Trees or erect shrubs, not climbers 4	
	Leaves simple, shortly stalked; flowers solitary or clustered in axils, with 4 or 5 petals; fruits globose to obovoid, sometimes lobed, smooth to rough, lacking pulp-vesicles; seeds few(some) Paramignya	
2.	Leaves compound, pinnate or trifoliolate (sometimes unifoliolate in juveniles)	
3.	Leaves with 3-9 leaflets; twigs and leaf-stalks prickly; fruits dry, splitting open; medium sized climber.  **Landa dri	
3.	Leaves with 3 leaflets; leaf stalk not winged; twigs and leaf-stalks not prickly, but axils with usually recurved spines. Flowers in axillary recemes or panicles; fruits globose to ellipsoid, mucilaginous, without pulp-vesicles; seeds 1-3	
4.	Erect shrub of mangrove or Nipa fringe; fruit 3-4-celled and angled, resembling an angled lemon; seeds very large, to 35mm long; ovules usually 4 per cell, but one maturing. Leaves simple; spines single or paired straight	
4.	Not as above5	
5.	Buds densely covered with minute rusty-reddish-brown hairs; leaves usually alternate, but rarely opposite, simple or compound pinnate with up to about 9 leaflets. Ovary 2-5-celled, the cells 1-ovulate. Fruit slightly fleshy, resinous	

5.	Buds glabrous, or if hairy, the hairs whitish, tawny, or grey. Leaves simple or pinnate, opposite or alternate. Ovary cells usually with 2 or more ovules (except <i>Paramignya</i> ). Fruit dry or fleshy		
6. 6.	Twigs and often also trunk prickly, with scattered prickles		
7. 7.	Leaves mostly with 3 to many leaflets		
8.	Leaves with 9-13 leaflets, those at base smallest, in a graded series with those at leaf tip the largest; leaf stalk flattened, narrowly winged; fruit large, ellipsoid, firm, the pulp fleshy and resinous; seeds numerous, large		
8.	Leaves with subequal leaflets, leaf-stalk winged or not; fruit various9		
9. 9.	Leaves with 5-31 leaflets, rarely a few with only 3; leaves sometimes pubescent		
	Inflorescence terminal, large, open, to 30cm long; flowers racemosely disposed, well spaced; crushed tissues foul-smelling		
	Leave opposite; trees; fruit a dehiscent capsule of follicles		
11.	Leaves alternate; trees or shrubs; fruit a berry		
12 12.	Leaves faintly scented if crushed; unripe fruits oblong; wild plants		
13	Leaflets 5, large, c. 12-18cm long; flowers very small (2.5mm long), in panicles c. 30 cm long; ovary 4-		
13.	celled, glabrous, with bulging glands		
14.	Leaf stalk broadly winged; fruit large, woody, globular, 5-7.5 cm wide; deciduous, cultivated tree		
14.	Leaf stalk not winged; fruit small, berrylike, to 12mm wide; seeds 1 or 2, hairy; wild or cultivated, evergreen, small tree or shrub		
15 15.	Leaves with usually 3, sometimes only 1 or 2, leaflets		
16. 16.	Twigs unarmed; leaves opposite; fruit indehiscent		
17.	Flowers 4- or 5-merous; fruit many-seeded, with hard woody shell; deciduous cultivated tree		
	Flowers 3-merous; fruit 1-3-seeded, fleshy; evergreen cultivated shrub		
18.	Twigs unarmed; leaves opposite		
19. 19.	Fruit dry, dehiscent		
20. 20.	Terminal bud glabrous; flowers with 4 stamens alternating with 4 staminodes; seeds winged <i>Tetractomia</i> . Terminal bud nearly glabrous to velutinous; flowers with 4 or 8 stamens (or staminodes); seeds not winged.  Melicope		
	Flowers bisexual; petals valvate; staminal filaments hairy		
	Flowers unisexual; petals imbricate; staminal filaments glabrous		
	Axillary spines short, curved, paired; fruit small, round, 2-seeded; shrubby plant Paramignya cuspidata Axillary spines longer, single or paired, straight; fruit usually 4cm wide or more, seeds usually more than 2; shrub or tree		

- 23. Fruit 3-5-celled, each cell with 1 or 2 seeds; stamens twice as many as petals; small, wild trees Atalantia

#### Supplementary notes:

Herbs of the genus *Ruta* (*R.graveolens L.*), the Rue plant, are occasionally grown as pot plants; they are readily recognizable by their herbaceous habit, glaucous foliage of compound leaves, pungent aroma, yellow flowers, capsular fruits, and angular seeds.

There is a recent revision of *Clausena* in: Molino, J.-F. (1994). Revision du genre *Clausena* Burm. f. (Rutaceae). Bull. Mus. Hist. Nat. (Paris), ser. 4, Sect. B, Adansonia 16(1), 105-153

#### Citrus L.

Citrus halimii Stone, in Stone, Lowry, Scora & Jong, Biotropica 5 (1973) 102. (after Sultan Abdul Halim Mu'azzam Shah ibni Almarhum Sultan Badlishah of Kedah. Citrus sp. A: Stone, in Tree Flora of Malaya 1 (1972) 375.

A tree up to 23m tall, trunk cylindric, straight, with ascending branches; bark smooth gray, thin; wood white. Leaves elliptic or narrowly elliptic, thin coriaceous, margins entire to obscurely and minutely subcrenulate, undersurface slightly paler than upper, somewhat olivaceous when dry, the blades 8-15cm long, 3.5-7.5 cm wide, copiously glandular but the adult leaves not highly fragrant; petioles articulated at both ends, usually 1-2cm long, the margins distinctly but narrowly winged. Main lateral nerves 7-11 pairs. Flowers solitary, in axils, pedicels to 3.5mm long; calyx of 5 deltate sepals with minutely ciliate margins; petals white, 3-5 (or more) mm long. Stamens 18-20, free or the filaments loosely connate in small groups of 2 or 3, glabrous, the anthers yellow. Ovary 6-10-celled, on a flat disc; style columnar, with 5-6-angled flat stigma; ovary cells with 1-3, rarely 5, ovules, Fruit about 5 x 5 cm but variable in size, subglobose to pyriform, at apex slightly concave, the rind glossy deep yellow, bumpy, copiously glandular, firmly adherent, about 6mm thick, with thin white endocarp; pulp vesicles numerous, subglobose to pyriform with slender stalk, pale greenish to yellowish-white translucent, containing acid juice. Seeds numerous, monoembryonic, to 18+ per fruit, large, flat, about 20 x 9mm, 3-3.5mm thick, narrowed at base, veiny rugulose, the chalazal cap pale magenta-pink; cotyledons white, the hypocotyl pale greenish-white.

S. Peninsular Thailand and Peninsular Malaysia, and Borneo (Sabah). In Malaya mostly in the Main Range at moderate altitudes typically between 2000 and 4500 feet (640-1450m). on ridges in submontane forest.

N.v. "limau kedut kera" or "Limau Kedangsa."

### Glycosmis Correa

(Gr. glucus = sweet; osmion=smell)

Ann. Mus. Paris 6 (1805) 384. Ridley, Flora 1 (1922) 348-51. Burkill, Dictionary (1935) 1086. Corner, Wayside Trees (1940) 571. Swingle, Citrus Ind. (1943) 153. Phoenicimon Ridl. (under Sapindaceae), Flora 5 Suppl. (1925) 301. Stone, in Whitmore, Tree Fl. Malaya 1 (1972) 380.

A genus of about 45 species from India and Sri Lanka through Burma, Thailand, southern China, Indochina, Taiwan, throughout Malesia E to NW & NE Australia, and introduced/naturalized in Florida, W.Indies, and elsewhere.

Continuing studies of this genus (Stone, Proc. Acad. Nat. Sci. Philadelphia 137, 1985) have greatly changed the taxonomy and nomenclature of this group and thus of the earlier account in the Tree Flora of Malaya, so the present account must completely replace the earlier one.

#### Key to Peninsular Malaysia species of Glycosmis

1.	Leaves all simple	
1.	Leaves with 3 or more leaflets, or rarely with 2 or 1 leaflet, thes same plant	
2.	Leaves leathery, oblong-obovate, to 6cm wide, with obscure ve axillary	ins, alternate; inflorescences much reduced. G. crassifolia Ridl. J. Roy. Asiat. Soc. Str. Br. 75 (1917) 14. Endemic, rare; known from Malacca and Pahang (Taman Negara).
2.	Leaves thin coriaceous, elliptic to ovate, wider than 6cm, with	obvious veins, sometimes opposite
3. 3.	Leaves of 3 leaflets, or sometimes only 2 or 1 or rarely 4 Leaves with 5 or more leaflet,s rarely 4 or 3	4 
4.	Ovary reddish pubescent; leaflets usually 1-3, elliptic, with about limestone hills	at 6 pairs of secondary veins. Sometimes on G. puberula Lindl. ex Oliver J. Linn Soc. Bot. 5 Suppl. 2 (1861) 39. Penang and Perak; S. Thailand, and a variety in Vietnam
4.	Ovary glabrous or with a very few, ephemeral, scattered hairs	
5.	Fruits to 2cm diam.; leaflets large, to 25 x 6cm, ovate, acur inflorescence pseudoterminal	G. collina Stone Proc. Acad. Nat. Sci. Phila. 137 (1985) 4. G. macrocarpa sensu Ridl. Flora 1 (1922) 349, non Wight 1840. Perak (G.Bubu), Pahang (Fraser's Hill). Montane. Endemic.
5.	Fruits smaller; leaflets smaller and/or of different form, with 4-15 pairs of secondary veins; inflorescence axillary	
6	Leaflets up to c.7.5 cm long, elliptic, with rather few (4-6) second glabrate, at first usually with a very few ephemeral scattered hai limestone hills	rs. Coastal areas, especially limestone, and

		India, Sri Lanka, Andaman Islands, Nicobar Islands, Mauritius, Laos, Hainan, and SE Borneo.	
6.	Leaflets often 12-15+ cm long, elliptic-lanceolate, with up to 15 diam. Ovary quite glabrous. Coastal areas, and secondary ve	5-16 pairs of secondary veins; fruit 10-12 mm egetation, sometimes in cultivation	
		538. G. citrifolia sensu Ridley, Flora 1 (1922) 349, non Lindley, 1826. In Malaya chiefly in the north. Also in India, Sri	
		Lanka, Burma, Thailand, SW China, and Indochina.	
7.	Leaflets 5-7, leathery, each with about 18 pairs of secondary veins, glabrous above, reddish-scurfy beneath large (to 23cm long and 10cm wide, the petiole 6mm long. Panicles elongated, to 20 cm long, densely reddish-pubescent, almost spikelike, with densely crowded small flowers; ovary 3-celled		
		Suppl. (1925) 301; not G. rubiginosa Ridl. Kew Bull. (1925) 78. Negri Sembilan, Pahang, Johore, Trengganu; Pulau Tioman and Anambas Islands. Rare but distinctive.	
7.	Leaflets large or considerably smaller and with few pairs of secondary veins; inflorescences much shorter, not spikelike		
8.	Ovary reddish-puberulent, 3-celled; leaflets 5 to 7, up to 34 cr veins; petals puberulent outside	G. macrophylla (Bl.) Miq. Fl. Ned. Ind. 1	
		(1859) 522. Sclerostylis macrophylla Bl. Bijdr. (1825) 135. G. sapindoïdes Lindl. ex Oliver J. Linn. Soc. Bot. 5 Suppl. 2 (1861) 38. G. elata Ridl. J. Fed. Mal. St.	
		Mus. 10 (1920) 130. Kedah, Kelantan, Penang. Andaman and Nicobar Islands, Thailand, Sumatra, Java, Sunda Isl., Kei	
8.	Ovary glabrous, 5- or 4-celled	Isl., Papua and W. Australia.	
9.	Leaflets 7-12, linear-lanceolate; rheophytic shrub	G. perakensis Narayanaswamy, Rec. Bot. Surv. India 14 (1941) 59. Perak, Pahang. Endemic.	
9.	Leaflets mostly 5-7, rarely 9 or only 3 or 4, not linear-lanceol		
10.	Leaflets small, usually 3-5, rarely 1 or 7, mostly 2.5-5 cm leflowers 4-merous		
		France 91 (1945) 216. Limestone hills in various states; W of Main Range as var.	
		trichanthera (syn. G.calcicola Stone, Gard. Bull. Sing. 26 (1972) 55); in Kelantan, var.	
		kelantanica (Stone) Stone, Proc. Acad. Nat. Sci. Phila. 137 (1985) 22, with much larger	
		leaflets. Restricted to karst limestone. The	
		typical variety occurs in Vietnam; another is found in Burma, and one more in	
		Sumatra. The notched leaflet tips together with small 4-merous flowers are reliable characters. This is a sharply distinct species.	
10.	Leaflets somewhat larger, not rounded and notched at the tip.		
	Leaflets usually elliptic to ovate, with wide-spaced rather fe terminal	12	
11.	Leaflets mostly elliptic-lanceolate, with rather numerous fine	secondary veins; inflorescences axillary	

ed. 16, 4 (1827) 162. Cookia chloro-sperma Bl. Bijdr. 3 (1925) 135. G.malayana Ridl. J. Roy. Asiat. Soc. Str.Br. 75 (1917) 12. G. monticola Ridl. 1.c. Widespread through the Malay Peninsula, lowlands and hills, in forest; common in W. Malesia. (1) var. chlorosperma: Widespread in the Peninsula. (2) var. angustifolia Narayana-swamy, Rec. Bot. Surv. India 14 (1941) 43. Perak, very local; S.Borneo. With narrow leaflets. (3) var. paraphyllophora Stone, Proc. Acad. Nat. Sci. Phila. 137 (1985) 3. Penang, Kedah, S. Thailand. Inflorescence bases with conspicuous paraphylls. (4) var. lindleyana (Swingle) Stone 1.c. Penang. With large 'simple' opposite leaves.

G.tomentella Ridl. J. Roy. Asiat. Soc. Str. Br. 75 (1917) 14; Flora 1 (1922) 350. Selangor (G.Nuang), rare in montane forest. Also in Sumatra.

#### Limonia L.

Limonia acidissima L. is the correct name for Feronia limonia (L.) Swingle, as used in Tree Flora Mal. 1 (1972) 370 (F. elephantum Corr. is another synonym). The genus Feronia is a synonym of Limonia which is monotypic. This species is exotic in the Malayan flora, and occurs only in cultivation. The woody-shelled fruits, the leaves with strongly winged rachis and usually 5 leaflets, and the deciduous habit distinguish it readily. For a fuller explanation of the nomenclature, see Stone & Nicholson, Taxon 27 (1978) 551.

## **Maclurodendron** Hartley

Gard. Bull. Sing. 35 (1982) 1-19.

(After F.A MaClure, American botanist specialized in bamboos)

Small to medium trees, all apparently dioecious. Indumentum brownish to rusty, of simple or fascicled hairs. *Leaves* opposite, unifoliolate, blades pinnately veined, pellucid glandular-punctate. Inflorescences axillary in upper axils, cymose, paniculate, or racemose. *Flowers* unisexual, 4-merous, the sepals valvate, petals narrowly imbricate, deciduous; stamens 8, free, unequal, those opposite petals shorter than the others, the longer ones about as long as the petals; filaments glabrous; anthers dorsifixed, sterile in pistillate flowers. Gynoecium 4-carpellate, rudimentary in staminate flowers, with an irregularly, shallowly 8-lobed disc; carpels 2-ovulate, the ovules collateral to subcollateral; style straight, with 4-lobed capitate stigma. *Fruit* a syncarpous drupe of 4 cells, with glandular leathery exocarp, pergamentaceous endocarp, and 1 or 2 ovoid to reniform glossy black *seeds* per cell; endosperm copious; embryo straight; cotyledons flattened.

A genus of 6 species from Burma, E to Indochina and S China, in W Malesia from the Malayan Peninsula to the Philipines; two species in Peninsular Malaysia.

#### Key to Malaysian species of Maclurodendron

- Flower buds 1-2mm wide, sepals and petals pubescent to glabrous outside; style scar unitary (scars confluent) at drupe apex. leaflet blades 5.5 24cm long ....... M.porteri (Hook.f.) Hartley, Gard. Bull. Sing. 35 (1982) 8. Acronychia porteri Hook. f. Fl. Brit. India 1 (1875) 498. All states and Singapore; Burma; W.Malesia.

#### Melicope J. R. & G. Forster

by T. G. HARTLEY

Char. Gen. Pl. (1775) 28, ed. 2 (1776) 55. Engler in Engler & Prantl, Nat. Pflanzenfam. ed. 2.19a (1931) 231. Hartley, Sandakania 4 (1994) 47.

(Gr. meli, honey, and kope, a cutting, referring to the emarginate lobes of the nectar-secreting, intrastaminal disc)

Shrubs (rarely scandent) or trees. Leaves opposite or whorled, digitately trifoliolate or unifoliolate. Inflorescences cymose or thyrsiform or sometimes reduced to solitary flowers, axillary or ramuligerous (i.e., on branchlets below leaves) or rarely terminal, ramigerous, or cauligerous. Flowers small, bisexual or functionally unisexual; sepals 4; petals 4, distinct, valvate or narrowly imbricate; stamens (rudimentary in 9 flowers) 8 or 4 or rarely 8-4, distinct; disc intrastaminal, pulvinate to annular or cupular; gynoecium (rudimentary or sometimes obsolete in of flowers) 4-carpellate, the carpels connate basally or up to their full length, with a common apical or subapical style or the stylar elements rarely becoming divergent, the stigma punctiform to capitate, peltate, or 4-branched, the ovules 2 or 1 per carpel. Fruit of 1-4 basally connate follicles (the abortive carpels, if any, persistent) or grading to syncarpous (carpels united into a 4-locular, loculicidally dehiscent capsule); endocarp pergamentaceous to cartilaginous, adnate to or separate from epicarp in mature fruit but not expelled at dehiscence. Seeds solitary or in pairs, remaining attached in dehisced fruit; testa with thick inner layer of dense, black sclerenchyma and spongy outer layer bounded externally by a shiny, black pellicle; endosperm copious; embryo straight or slightly curved, the cotyledons ± flattened, elliptic, planate, the hypocotyl superior.

Malagasy and Indo-Himalayan regions eastward to the Hawaiian and Marquesan Islands and south to New Zealand. About 230 species, 10 of which occur in the Malayan Peninsula (i.e., in Peninsular Malaysia and/or Singapore).

*Melicope* is characterized mainly by its combination of opposite or whorled, digitately trifoliolate or unifoliolate leaves, dehiscent fruit, and shiny, black, pelliculose seeds which remain attached in the dehisced fruit. *Euodia J.R.& G.* Forster, with which *Melicope* was long confused, consists of seven species and

ranges from New Guinea and northeastern Australia east to Samoa, Tonga, and Niue. Like *Melicope*, it has opposite, digitately trifoliolate or unifoliolate leaves and dehiscent fruit, but its seeds are neither shiny nor pelliculose and they are forcibly expelled, along with the endocarp, when the fruit dehisces. This classification of the two genera was first proposed in a revision of the southeast Asian genus *Tetradium* Lour. (Hartley, Gard. Bull. Sing. 34 (1981) 91-131), which itself was long confused with *Euodia*, and was followed in a recent account of the Bornean species of *Melicope* (Hartley, Sandakania 4 (1994) 47-74).

The manner of attachment of the seed in the dehisced fruit or *Melicope* is variable and provides a useful taxonomic character. In some species, the attachment is either by a partially detached axile strip of pericarp tissue or by a partially detached raphe, or by both. This kind of attachment, which is seen in species 1, as enumerated below, is designated as Type A. In other species, neither the pericarp nor the raphe detaches and the two are connected by a funiculus which ranges up to about 3 mm in length. This manner of attachment, which is seen in species 2-10 below, is designated as Type B.

Seeds of *Melicope* are often irregularly angled when two develop in a single fruiting carpel. These shapes, which are caused by crowding, are not given in the descriptions.

In the above-mentioned account of the Bornean species of *Melicope*, full descriptions were given for five species that also occur in the Malayan Peninsula, namely, *M. accedens* (Blume) T. Hartley, *M. denhamii* (Seem.) T. Hartley, *M. glabra* (Blume) T. Hartley, *M. hookeri* T. Hartley, and *M. lunu-ankenda* (Gaertn.) T. Hartley. Those descriptions are not repeated here. The synonymies given herein are intended to be relevant only to the Malayan Peninsula. *Melicope accedens*, *M. denhamii*, *M. glabra*, and *M. lunu-ankenda* have additional synonyms outside this region. With one exception (see *Evodia* sensu Gaertner, mentioned in the synonymy of *M. lunu-ankenda*), the original spelling *Euodia* is used throughout the synonymies, correcting the orthographic variant *Evodia*, which was used by most of the authors.

### Key to species of Melicope in the Malayan Peninsula

	Leaves, or most of them, unifoliolate
2.	Flowers with 8 stamens; endocarp separate in mature fruit; young branchlets 4-5 mm wide in third internode, becoming manifestly corky
2.	Flowers with 4 stamens; endocarp adnate in mature fruit; young brachlets 2.5-3.5 mm wide in third internode, not becoming manifestly corky
	Leaflet blades (as seen in the Malayan Peninsula) lobed, sinuate, or repand; plants cultivated or possibly escaped
3.	Leaflet blades entire4
	Trichomes mostly fasciculate or stellate

5.	the endocarp glabrous; indumentum of leaflet blades mostly restricted to midrib and margin	
5.	Petals (as seen in the Malayan Peninsula) 1-3 mm long, the abaxial surface glabrous or with sparse indumentum; fruiting carpels (as seen in the Malayan Peninsula) 2.5-5 mm long, or, if larger, then the endocarp pubescent; indumentum of leaflet blades, if present, not as above	
6. 6.	Fruiting carpels (7.5-) 10-11 mm long; endocarp and locules of ovary with indumentum8. <i>M. macrocarpa</i> Fruiting carpels 2.5-5 mm long; endocarp and locules of ovary glabrous	
7. 7.	Petals 1-1.5 mm long, glabrous, persistent in fruit; fruiting carpels 2.5-3 mm long	
8.	Terminal leaflet blades obovate or broadly so, (7.5-) 9-16.5 cm long, the main veins plane or impressed above, 9-15 on each side of midrib, divergent at angle of 50-60°, the apex usually abruptly and obtusely short-acuminate; main branches of inflorescences ascending; fruiting carpels 3-4 mm long 3. M. glabra	
8.	Terminal leaflet blades (as seen in the Malayan Peninsula) elliptic to obovate, 6-30 cm long, the main veins prominulous to impressed above, 11-22 on each side of midrib, divergent at angle of 60-70°, the apex usually acuminate; main branches of inflorescences spreading or ascending; fruiting carpels 3.5-5 mm long	
<ul><li>9.</li><li>9.</li></ul>	Leaflet blades glabrous or nearly so, up to 22 cm long, the main veins prominulous above; main branches of inflorescences usually ascending; fruiting carpels about 5 mm long	
	impressed above; main branches of inflorescences usually spreading; fruiting carpels 3.5-4.5 mm long	

#### 1. Melicope suberosa B. Stone

Gard. Bull. Sing. 36 (1983) 94, fig. 1,2; tab. 1. Type: Peninsular Malaysia: Pahang: Genting Highlands, Gunong Ulu Kali, Stone & Lowry 15338 (CANB, Isotype).

Tree to 10 m high, trunk to 15 cm diam., like the branches with rugose pale corky bark; trichomes simple or fasciculate. Young branchlets like the petioles glabrous or nearly so, becoming manifestly corky, 4-5 mm wide in third internode; terminal bud densely puberulent. Leaves opposite, unifoliolate, 7.5-21.5 cm long; petiole 1-4 cm long, 1-2 mm wide at middle; petiolule obsolete; leaflet blade chartaceous, glabrous, elliptic or elliptic-obovate, 6.5-17.5 x 3-9.5 cm, the base obtuse to acute, the margin entire or in occasional leaves few-crenulate toward apex, the apex obtuse to subacuminate, the midrib plane above, the main veins prominulous above, 10-15 per side, divergent at angle of 65-70°, the veinlet reticulation ± obscure. Inflorescences axillary, few-flowered, 1.5-2 x 1.3-1.5 cm, the peduncle nearly glabrous or sparsely puberulent, 0.8-1.3 cm long, the pedicels puberulent, 1.5-2 mm long (about 3 mm long in fruit). Flowers unisexual (only ♀ seen), plants probably dioecious; sepals puberulent or sparsely so abaxially, glabrous adaxially, connate at base, ovate-triangular, about 1.5 mm long, persistent in fruit; petals greenish white, narrowly imbricate, sparsely puberulent abaxially, glabrous adaxially, ovate-elliptic, about 4 mm long, deciduous in fruit; stamens 8, infertile, the antesepalous ones about 2 mm long, the filament glabrous, narrowly obtuse at apex, the anther 0.6-0.8 mm long; disc glabrous; gynoecium 2.2-2.7 mm long, the ovary puberulent or sparsely so, the carpels 2-ovulate, the style puberulent in proximal 1/2, including stigma 1.5-2 mm long, the stigma capitate, weakly 4-lobed, about 0.6 mm wide. *Fruiting carpels* connate at base, divaricate, subglobose to broadly ellipsoid, about 8 mm long, the exocarp dry, glabrate, the endocarp glabrous, separate; seed attachment Type A; *seeds* ellipsoid, about 7 mm long.

Known only from the type locality in central Peninsular Malaysia; forest at 1550 m.

Melicope suberosa is most nearly related to M. jugosa T. Hartley and M. sororia T. Hartley, which are endemic to Borneo. It differs from those species mainly in having manifestly corky branchlets, persistent sepals, puberulent petals and ovary, and smaller fruiting carpels. Among its congeners in the Malayan Peninsula, it is the only species with 8-staminate flowers, separate endocarp, and Type A seed attachment.

The specific epithet (from the Latin *suberosus*, corky) refers to the thick bark of the branches and trunk.

#### 2. Melicope denhamii (Seem.) T. Hartley

Sandakania 4 (1994) 57. Picrasma denhamii Seem., Fl. Vit. (1865) 33. Type: New Hebrides: Aneitum [Aneityum], McGillivray 46 (BM, Holotype).

Aralia quercifolia Anon., Gard. Chron. (1881) 785, fig. 140, nom, prov.; hort. ex Truff., Rev. Hort. (1891) 224. Euodia quercifolia (hort. ex Truff.) Ridl., Gard. Chron., ser. 3, 76 (1924) 303. Type not designated. The illustration of Aralia quercifolia is reasonably adequate for the identification of this plant.

Euodia ridleyi Hochr., Icon. Bogor 2 (1905) tab. 151. Euodia schullei var. ridleyi (Hochr.) Lauterb., Bot. Jahrb. Syst. 55 (1918) 230. Euodia suaveolens var. ridleyi (Hochr.) Bakh. f., Blumea 6 (1950) 365. Probable type: Java: Bot. Gard. Bogor (ex Bot. Gard. Singapore), Backer, Dec. 1904 (U, Isotype).

Borneo east to the southern Philippines and Caroline Islands and southeast throughout eastern Malesia to the Solomon Islands, New Hebrides, and Fiji. In the Malayan Peninsula, only putative cultigens of the species are known. These are represented by collections made from Bot. Gard. Univ. Malaya (Kuala Lumpur) and Bot. Gard. Singapore.

From their congeners in the Malayan Peninsula, the cultigens of *Melicope denhamii* (which apparently orginated in Papuasia) are immediately recognizable by their lobed, sinuate, or repand leaflet blades. The specific epithet commemorates H. M. Denham, a British sea captain.

## 3. Melicope glabra (Blume) T. Hartley

Sandakania 4 (1994) 60. Fagara glabra Blume, Catalogus (1823) 40. Euodia glabra (Blume) Blume, Bijdr. (1825) 245. Ampacus glabra (Blume) Kuntze, Revis. Gen. Pl. 1 (1891) 98. Type: Java: Blume (US, Lectotype, designated by Hartley, opp. cit.).

Euodia kingii Engl. in Engl. & Prantl. Nat. Pflanzenfam. III. 4 (1896) 121. Type: Malakka [Malaya sensu Engler]: "E. glabra King in herb." The B material of this was presumably lost. It was probably the same plant that King (J.Asiat. Soc. Bengal, pt. 2, Nat. Hist. 62 (1893) 208) correctly identified as Euodia glabra (Blume) Blume.

Malayan Peninsula to Sumatra and western Java. In the Malayan Peninsula, known from Penang, Perak, Trengganu, Selangor, Pahang, Johore, and Singapore; primary and secondary forest from near sea level to 450 m.

*Melicope glabra* is most nearly related to *M. lunu-ankenda*, differing mainly in the following combination of features: terminal leaflet blades obovate or broadly so, (7.5-) 9-16.5 x 4-12 cm, the apex abruptly and usually obtusely acuminate or sometimes rounded, obtuse, or emarginate, the midrib impressed above, the main veins plane or impressed above, 9-15 per side, divergent at angle of 50-60°; fruiting carpels 3-4 mm long.

#### 4. Melicope lunu-ankenda (Gaertn.) T. Hartley

Sandakania 4 (1994) 61. Fagara lunu-ankenda Gaertn., Fruct. Sem. Pl. 1 (1788) 334, tab. 68, fig. 9. Fagara zeylanica J.F. Gmelin, Syst. Nat. 2 (1791) 258 (not seen); Syst. Veg. 1 (1796) 258, nom. illeg. Zanthoxylum zeylanicum (J. F. Gmelin) DC., Prodr. 1 (1824) 728, nom. illeg. Euodia lunu-ankenda (Gaertn.) Merr., Philipp. J. Sci. (Bot.) 7 (1912, publ. 1913) 378, as lunur-ankenda. Type: Ceylon, König (L, Holotype).

[Fagara triphylla sensu Roxb., Fl. Ind. 1 (1820) 436, excl. syn., non Lam. 1798.] Zanthoxylum roxburghianum Cham., Linnaea 5 (1830) 58. Euodia roxburghiana (Cham.) Benth., Fl. Hongk. (1861) 59. Ampacus roxburghiana (Cham.) Kuntze, Revis. Gen. Pl. 1 (1891) 98. Euodia malayana Ridl., Fl. Malay Penins. 1 (1922) 342, nom, illeg. Type: cult. Bot. Gard. Calcutta; introduced by Roxburgh from Penang (not seen).

Roxburgh's description, apparently drawn up from living material at Calcutta, is reasonably adequate for the identification of this plant. It is doubtful if a type was preserved. Roxburgh incorrectly gave Linnaeus as the author of *Fagara triphylla*. In the reference he cited (Sp. Pl. ed. Willd. 1 (1798) 666). Willdenow correctly referred the species to Lamarck.

Himalaya southward to Ceylon, Java, Celebes, and southwestern Philippines. In the Malayan Peninsula, known from Province Wellesley, Perak, Selangor, Pahang, Negri Sembilan, Malacca, Johore, and Singapore; coastal and inland primary and secondary well-drained forest and peat swamp; to 60 m.

*Melicope lunu-ankenda* is most nearly related to *M. glabra* (q.v.). The specific epithet is a Ceylonese name for the plant.

### 5. Melicope corneri T. Hartley, sp. nov.

Type: Peninsular Malaysia: Selangor: Ulu Gombak, Carrick 1468 (L, Holotype).

Arbor 4.5-7.5 m alta, trichomatibus pro parte maxima simplicibus; foliis trifoliolatis, 34-51 cm longis; foliolorum laminis chartaceis, saltem subtus in costa et venis primariis et supra in costa  $\pm$  sparse pubescentibus, in foliolo terminali ellipticis usque obovatis, 20-31 x 7-12 cm; inflorescentiis axillaribus, multifloris, 4-10 x 3-8 cm, ramis principalibus patentibus; floribus unisexualibus (plantae dioeciae); sepalis ca. 0.5 mm longis, in fructu persistentibus; petalis glabris, 1-1.5 mm longis, in fructu persistentibus; staminibus 4, in floribus  $\Diamond$  ca. 2.5mm longis (in floribus  $\Diamond$  1-1.5 mm longis), filamento glabro, apice subulato usque filiformi, anthera ca. 0.6 mm longa (in floribus  $\Diamond$  ca. 0.3 mm longa); gynoecio in floribus  $\Diamond$  ca. 1 mm longo (in floribus  $\Diamond$  ca. 0.3 mm longo), stigmate capitato, inconspicue 4-lobato; carpellis fructificantibus basi connatis, 2.5-3 mm longis, endocarpio glabro, saltem apicem versus adnato; seminibus per Type B affixis, ca. 2 mm longis.

Tree 4.5-7.5 m high, trichomes mostly simple. Young branchlets like the petioles pubescent, 5.4-7 mm wide in third internode; terminal bud velutinous. Leaves opposite, trifoliolate, 34-51 cm long; petiole 12-19 cm long, 2-4 mm wide at middle; petiolule in lateral leaflets obsolete or up to 3 mm long, in terminal leaflet 2-5 mm long; leaflet blades chartaceous, ± sparsely pubescent, at least on midrib and main veins below and on midrib above, in lateral leaflets elliptic or elliptic-obovate, in terminal leaflet elliptic to obovate, 20-31 x 7-12 cm, the base in lateral leaflets obtuse to acute, in terminal leaflet acute to subattenuate, the margin entire, the apex acuminate, the midrib and main veins slightly impressed above, the main veins in terminal leaflet 15-20 per side, divergent at angle of 60-70°, the veinlet reticulation prominulous to obscure. *Inflorescences* axillary, many-flowered, 4-10 x 3-8 cm, the axis and branches pubescent, the peduncle 1-5 cm long, the main branches spreading, the pedicels puberulent or sparsely pubescent, 0.7-2 mm long (1.5-2 mm long in fruit). Flowers unisexual, plants dioecious; sepals sparsely puberulent abaxially, glabrous adaxially, connate at base or up to 1/4 their length, ovate or ovate-triangular, about 0.5 mm long, persistent in fruit; petals cream or greenish, narrowly imbricate, glabrous, ovateelliptic, 1-1.5 mm long, persistent in fruit; stamens 4, in 3 flowers about 2.5 mm long (1-1.5 mm long in ♀ flowers), the filament glabrous, subulate to filiform at apex, the anther about 0.6 mm long (about 0.3 mm long in 9 flowers); disc pubescent or sparsely so; gynoecium in 9 flowers about 1 mm long (about 0.3 mm long in & flowers), the ovary pubescent or sparsely so, the carpels 2-ovulate, the style pilosulose, at least in proximal 1/2, including stigma about 0.7 mm long, the stigma capitate, weakly 4-lobed, 0.25-0.3 mm wide. Fruiting carpels connate at base, divaricate, subglobose or broadly ovoid to obovoid, 2.5-3 mm long, the exocarp subfleshy, glabrate, the endocarp glabrous, adnate, at least toward apex; seed attachment Type B, the funiculus about 0.6 mm long, 0.3-0.5 mm wide at middle; seeds ellipsoid, about 2 mm long.

Endemic to Peninsular Malaysia; primary forest and borders; 18-750 m.

Paratypes: Peninsular Malaysia: Selangor: Gunong Bunga Buah, Whitmore FRI 337 (A, L); Ulu Gombak, Stone 6892 (CANB); genting Simpah, Poore 236 (CANB). Pahang: Genting Highlands, Chung 1 (KLU). Negri Sembilan: Jelebu, Everett KEP 104947 (A, L), Johore: Gunong Belumut, Whitmore FRI 8771 (L); Kota Tinggi, Sungai Pelepah, Corner SF 31433 (A, BO). Peninsular Malaysia without precise locality, Herb. Maingay Kew Distrib. No. 277 pro parte (L).

Melicope corneri is most nearly related to M. accedens, differing mainly in its smaller anthers and seeds and its combination of usually smaller, glabrous, persistent petals and usually smaller fruiting carpels. The specific epithet commemorates Edred J. H. Corner.

#### 6. Melicope accedens (Blume) T. Hartley

Sandakania 4 (1994) 67. Euodia accedens Blume, Bijdr. (1825) 246. Zanthoxylon accedens (Blume)

Miq., Fl. Ned. Ind. 1(2) (1859) 671. Ampacus accedens (Blume) Kuntze, Revis. Gen. Pl. 1 (1891) 98. Type: Java, Blume (L, Lectotype, designated by Hartley, opp. cit.).

Euodia pilulifera King, J. Asiat. Soc. Bengal, pt. 2, Nat. Hist. 62 (1893) 210. Syntypes: Peninsular Malaysia: Perak: Larut, King's collector (Kunstler) 6275 (CAL, Holosyntype; L, US, Isosyntypes); without precise locality, Scortechini 360 (not seen), Wray 2995 (not seen).

Andaman Islands east to Vietnam and south to Java. In the Malayan Peninsula, known from Kedah, Perak, Trengganu, Selangor, Pahang, Malacca, and Johore; primary and secondary forest from near sea level to 1980 m.

*Melicope accedens* is most nearly related to *M. corneri* (q.v.). The specific epithet (from the Latin *accedo*, approaching or resembling) was most likely intended by Blume to refer to the relationship of the species to *Euodia macrophylla* Blume. The latter is now considered to be conspecific with *M. accedens* (Hartley, Sandakania 4 (1994) 67).

As Hartley noted in Sandakania 4 (1994) 69, two variants of *Melicope accedens* occur in Peninsular Malaysia. Plants described in that account as Variant A correspond with specimens centering around the type of *M. accedens*, whereas those described as Variant B corresponds with specimens centering around the type of *M. pilulifera*.

#### 7. **Melicope hookeri** T. Hartley

Sandakania 4 (1994) 70. Euodia robusta Hook. f., Fl. Brit. Ind. 1 (1875) 488. Ampacus robusta (Hook.f.) Kuntze, Revis, Gen. Pl. 1 (1891) 98. Syntypes: Malayan Peninsula: Penang, Phillips (not seen); Singapore, Herb. Maingay Kew Distrib. No. 278 pro parte (GH, Lectotype, designated by Hartley, opp. cit.). A Leiden sheet with this Maingay number is Melicope glabra.

Peninsular Malaysia (Negri Sembilan: Berembun Forest Reserve), Singapore (Bukit Timah Forest Reserve), Sumatra, and Borneo; primary and secondary forest and borders; at lower altitudes throughout the range and ascending to 1600 m in Borneo.

*Melicope hookeri* is very closely related to *M. incana* T. Hartley, which occurs in east-central Sumatra, Borneo, and northern Celebes. The latter species differs mainly in its densely whitish-tomentose leaflet blades. From its trifoliolate congeners in the Malayan Peninsula, *M. hookeri* is readily distinguishable (with adequate magnification) by its mostly fasciculate or stellate trichomes.

#### 8. Melicope macrocarpa (King) T. Hartley, comb. nov.

Euodia macrocarpa King, J. Asiat. Soc. Bengal, pt.2, Nat. Hist. 62 (1893) 209. Syntypes: Peninsular Malaysia: Perak: Larut, King's collector 7489 (L, Lectotype, here designated; US, Isolectotype); without precise locality, Wray 2618 (not seen), 3266 (not seen).

Tree 5-21 m high, trichomes mostly simple. Young branchlets like the petioles and inflorescences velutinous or minutely so or rarely sparsely puberulent, 5-8 mm wide in third internode; terminal bud velutinous or rarely appressed-pubescent. *Leaves* opposite, trifoliolate (occasional leaves unifoliolate), 18-43 cm long; petiole 4.5-16.5 (-20) cm long, 2-4 mm wide at middle; petiolule in lateral

leaflets 1-9 mm long, in terminal leaflet 2-12 mm long; leaflet blades subcoriaceous or coriaceous, sparsely puberulent to pubescent below, especially on midrib and main veins, puberulent on midrib or glabrous above, elliptic or narrowly so to obovate or in lateral leaflets sometimes narrowly ovate-elliptic, in terminal leaflet 11-32 x 5-15 cm, the base acute to subattenuate, the margin entire, the apex acuminate or abruptly so or sometimes rounded, the midrib plane or slightly impressed above, the main veins prominulous to slightly impressed above, in terminal leaflet 14-22 per side, divergent at angle of 60-75°, the veinlet reticulation prominulous or plane below or obscure. Inflorescences axillary, many-flowered, 7-14 x 3.5-13cm, the peduncle 1-6 cm long, the main branches ascending, the pedicels 1.5-2 mm long (2.5-3 mm long in fruit). Flowers unisexual, plants dioecious; sepals nearly glabrous to puberulent abaxially, glabrous adaxially, connate at base or up to 1/4 their length, ovate, 0.6-1 mm long, persistent in fruit; petals white, narrowly imbricate, glabrous or rarely sparsely strigillose abaxially, glabrous or rarely in proximal 1/3-1/2 sericeous adaxially, ovate-elliptic, 2.7-3 mm long, deciduous in fruit; stamens 4, in 3 flowers 4-4.5 mm long (1.5-2 mm long in 9 flowers), the filament glabrous abaxially, sparsely pilosulose in proximal 1/4 adaxially, subulate to filiform at apex, the anther about 1.5 mm long (0.8-1 mm long in 9 flowers); disc pubescent or villosulous; gynoecium in 9 flowers about 2.5 mm long (about 1 mm long in of flowers), the ovary pubescent, the carpels 2ovulate, the style pubescent to pilosulose, including stigma about 1.5 mm long, the stigma capitate, weakly 4-lobed, about 0.6 mm wide. Fruiting carpels connate at base, divaricate, ellipsoid to obovoid, (7.5-) 10-11 mm long, the exocarp subfleshy, puberulent to velutinous, the endocarp pubescent, adnate, at least toward apex; seed attachment Type B, the funiculus 1.5-2.5 mm long, 0.5-0.6 mm wide at middle; seeds ovoid to ellipsoid or rarely subglobose, (4-) 5.5-7 mm long.

Peninsular Malaysia (Penang, Perak, Selangor, and Pahang) and northern Sumatra; primary and secondary forest; mostly at lower altitudes but ascending to 1500 m in Pahang.

From its congeners in the Malayan Peninsula, *Melicope macrocarpa* differs mainly in having indumentum on its endocarp and in the locules of its ovary.

## 9. Melicope pachyphylla (King) T. Hartley, comb. nov.

Euodia pachyphylla King, J. Asiat. Soc. Bengal, pt. 2, Nat. Hist. 62 (1893) 210; Ann. Roy. Bot. Gard. (Calcutta) 9 (1901) 12, tab. 15. Syntypes: Peninsular Malaysia: Perak: Gunong Batu Puteh, Wray 229 (L, Lectotype, here designated); Gunong Babu, King's collector (Kunstler) 7432 (L, Isosyntype), Scortechini 732 (not seen), Wray 3835 (not seen). Pahang: Gunong Berumbun, Wray 1571 (UC, Isosyntype).

Shrub or tree 1.2-4.5 m high, trichomes mostly simple. Young branchlets like the terminal bud, petioles, and inflorescences pubescent to velutinous, 3-5.5 mm wide in third internode. *Leaves* opposite, trifoliolate, 6-25 cm long; petiole 2-11 cm long, 1.5-3 mm wide at middle; petiolules 1.5-15 mm long; leaflet blades

subcoriaceous or coriaceous, puberulent or pubescent on midrib below and, toward base, on midrib above and margin, otherwise glabrous or nearly so, elliptic to obovate, in terminal leaflet 4-12.5 x 2-5.5 cm, the base acute to attenuate or in lateral leaflets obtuse, the margin entire, the apex rounded or emarginate to short-acuminate, the midrib impressed above, the main veins prominulous above, in terminal leaflet 9-13 (-17) per side, divergent at angle of 70-75°, the veinlet reticulation obscure. *Inflorescences* axillary, several- or manyflowered, 3-9 x 2-3.5 cm, the peduncle (0.35-) 1.5-6 cm long, the main branches ascending, the pedicels 1-3 mm long (3-4 mm long in fruit). Flowers unisexual, plants dioecious; sepals pubescent to velutinous abaxially, glabrous adaxially, connate at base, ovate or ovate-triangular, (1-) 1.5-2 mm long, persistent in fruit; petals white or cream, narrowly imbricate, rather fleshy, appressed-pubescent abaxially, sericeous-pubescent adaxially, ovate-elliptic, (2.5-) 3.3-4 mm long, deciduous in fruit; stamens 4, about 3 mm long, the filament glabrous abaxially, sparsely pilosulose in proximal 1/6-1/3 adaxially, narrowly obtuse or sometimes acute at apex, the anther in 3 flowers 1.5-1.7 mm long (0.7-0.8 mm long in 9 flowers); disc glabrous; gynoecium in ♀ flowers 1.2-2.5 mm long (about 0.6 mm long in 3 flowers), the ovary and style pubescent, the carpels 2-ovulate, the style including stigma 0.6-1.5 mm long, the stigma clavate or rarely capitate and weakly 4-lobed, 0.3-0.4 mm wide. Fruiting carpels connate at base, divaricate, ellipsoid, 8-10 mm long, the exocarp dry, puberulent or glabrate, the endocarp glabrous, adnate, at least toward apex; seed attachment Type B, the funiculus about 1 mm long, about 1 mm wide at middle; seeds subglobose or ellipsoid, 4.5-5 mm long.

Endemic to Peninsular Malaysia, where known from Perak and Pahang; forest and open ridges, 1350-2000 m.

From its trifoliolate congeners in the Malayan Peninsula, *Melicope pachyphylla* is distinguishable mainly by its petals, which are rather fleshy, appressed-pubescent abaxially, sericeous-pubescent adaxially, and comparatively large; by its stigma, which is usually clavate; by its fruiting carpels, which are comparatively large and have glabrous endocarp; and by its leaflet blades, in which the indumentum is mostly restricted to the midrib and margin.

### 10. Melicope pahangensis T. Hartley, nom. nov.

Euodia simplicifolia Ridl., J. Linn. Soc., Bot. 38 (1908) 306. Type: Peninsular Malaysia: Pahang: Gunong Tahan, Wray & Robinson 5492 (BM, Holotype; SING, Isotype). The specific epithet simplicifolia is pre-empted in Melicope.

Shrub about 2 m high, trichomes simple. Young branchlets like the petioles nearly glabrous to puberulent and  $\pm$  glaucous, 2.5-3.5 mm wide in third internode; terminal bud sparsely puberulent to appressed-pubescent. *Leaves* opposite, unifoliolate (rarely occasional leaves bifoliolate), 6-11.5 cm long; petiole 1-2 cm long, 1-1.5 mm wide at middle; petiolule obsolete; leaflet blade subcoriaceous or

coriaceous, glabrous, ovate to elliptic, 5-10 x 2.5-4.5 cm, the base rounded to acute, the margin entire, the apex acute to acuminate, the midrib prominulous or plane above, the main veins prominulous above, 8-11 per side, divergent at angle of 60-70°, the veinlet reticulation prominulous or ± obscure. Inflorescences axillary, puberulent, several-flowered, 2-2.5 x 0.8-1 cm, the peduncle 1-1.8 cm long, the main branches ascending, the pedicels 1.5-2.5 mm long (1.5-3.5 mm long in fruit). Flowers unisexual (only 9 seen), plants probably dioecious; sepals sparsely puberulent abaxially, glabrous adaxially, connate at base, ovate-triangular, 0.7-0.8 mm long, persistent in fruit; petals (colour unknown) narrowly imbricate, glabrous abaxially, sparsely and minutely puberulent in proximal 1/3 adaxially, ovate-elliptic, about 2 mm long, deciduous in fruit; stamens 4, infertile, 0.6-0.8 mm long, the filament glabrous, acute at apex, the anther 0.3-0.5 mm long; disc pubescent; gynoecium 2-2.5 mm long, the ovary pubescent, the carpels 2-ovulate, the style pubescent in proximal 1/3, including stigma 1.5-2 mm long, the stigma capitate, weakly 4-lobed, 0.5-0.6 mm wide. Fruiting carpels connate at base, ascending, ellipsoid, 6.5-8.5 mm long, the exocarp dry, puberulent or glabrate, the endocarp glabrous, adnate, at least toward apex; seed attachment Type B, the funiculus about 0.4 mm long, about 0.6 mm wide at middle; seeds subglobose to ellipsoid, 4.5-5 mm long.

Endemic to Peninsular Malaysia, where known only from Pahang (Gunong Tahan and Gunong Brinchang); forest from 1500-2100 m.

From its congeners in the Malayan Peninsula, *Melicope pahangensis* differs mainly in its combination of unifoliolate leaves, 4-staminate flowers, adnate endocarp, and Type B seed attachment.

## **Excluded species**

In his treatment of *Euodia* in Tree Fl. Malaya 1 (1972) 376-379, Stone included two species that are now believed not to occur in the Malayan Peninsula, namely, *E. latifolia* DC. and *E. euneura* (Miq.) Miq. The former, which has been transferred to *Melicope* (Hartley, Sandakania 4 (1994) 72), ranges from Java northward to Borneo and the Philippines and eastward to Samoa. It is superficially similar to *M. accedens* and *M. corneri*, with which Stone apparently confused it. The latter, which is to be transferred to *Melicope*, is believed to be endemic to southern Sumatra. Stone apparently confused it with pubescent-leaved plants of *M. macrocarpa*, which is one of its close relative, although his description of the fruit fits neither species.

Index to numbered collections of Melicope from the Malayan Peninsula

The numbers in parentheses refer to the corresponding species in the text.

Thanks are extended to the directors and curators of A, AAU, BISH, BM, BO, BRI, CAL, CANB, GH, K, KLU, L, MEL, NSW, NY, P, SING, U, UC, UKMB, US, and W for making specimens in their care available for this study.

#### Tetractomia Hook.f.

This genus has been revised by Hartley (J. Arnold Arb. 60 (1979) 127) with *Terminthodia* Ridley being reduced to synonymy under it. The species *Terminthodia viridiflora* Ridley, previously accepted in the Tree Flora account (p. 385) has also been reduced to a synonym of *Tetractomia tetrandrum* (Roxb.) Craib. Hartley recognizes three forms in the Malayan Peninsula, the "generalized"

form," the "Malayan mountain race," and the "peat swamp race." He regards Terminthodia as a representative of the Malayan mountain race, in which he also includes Tetractomia holtumii (already synonymized in the Tree Flora account.) Hartley states that "a complete range of intermediates between the generalized form and the Malayan mountain race exists in Malayan forests between 900 and 1400 m altitude, and it is evident that the latter is merely a high mountain extreme of the former. The peat swamp race is reasonably distinct from the generalized form in the Malay Peninsula in having inflorescences shorter than the subtending leaves and a tendency toward smaller petals and follicles." Tetractomia majus is upheld as a distinct species. The account of Tetractomia therefore remains as originally published except for the inclusion of Terminthodia, and the reduction of Terminthodia viridiflora to the synonymy of Tetractomia tetrandrum.

It may be emphasized that the gender of the name *Tetractomia* is neuter, not feminine. The name *T. majus* is correct but deceptive, as the epithet is the comparative form of the adjective for large, i.e. equivalent to 'larger'.

#### Tetradium Lour.

Loureiro, Fl. Cochinch. (1790) 91; not of Dulac, 1867. HARTLEY Gard. Bull, Sing. 34 (1981) 91. Gr. tetradion, quaternion, referring to the 4-merous flowers and fruit of Tetradium trichotomum Lour.

Trees or shrubs, usually dioecious, deciduous or evergreen. Indument of simple hairs. Leaves opposite, pinnate, mostly with a terminal leaflet, the lateral leaflets usually stalked, their blades usually oil-dotted. Inflorescences corymbose to occasionally paniculate, terminal or both terminal and in the upper axils. Flowers unisexual (but rarely bisexual), 4-5-merous, with valvate, persistent sepals; petals narrowly imbricate in bud, deciduous; stamens opposite the sepals, longer than the petals in staminate flowers; filaments usually villous up to the middle, anthers ovoid, dorsifixed; stamens rudimentary or obsolete in pistillate flowers. Intrastaminal disc present. Gynoecium in pistillate flowers about as long as the petals, carpels free or connate at base, forming a lobed to subglobose or obovoid ovary; carpels 2- (or 1-) ovulate; style apical with peltate 4-5-lobed stigma, Carpels in staminate flowers rudimentary, fingerlike. Fruit follicular, the follicles 1-2-seeded, dehiscent adaxially, apically and partly down the abaxial surface; endocarp cartilaginous, persistent. Seeds dark brown to glossy black, smooth, retained within the follicle; endosperm fleshy; embryo straight; cotyledons plano-convex; hypocotyl terminal.

A genus of 9 species of India, Indochina, China, Korea, Japan and the Ryukyu Islands, W.Malesia including the Philippines and Sumatra, but not in Borneo. Most of the species had originally or subsequently been placed in *Euodia* and there is a general resemblance. Two species in Peninsular Malaysia; both very rare and only in the northern region.

# Key to the Peninsular Malaysian species of Tetradium

- Follicles 2-seeded though ofter seemingly 1-seeded; flowers 4-merous; leaflets greenish, hairy ......

  Tetradium sambucinum

  1 Follicles 1-seeded; flowers 5 merous; leaflets all.
- 1. Follicles 1-seeded; flowers 5-merous; leaflets glabrous or slightly pubescent, usually glaucous beneath...

  Tetradium glabrifolium

### Tetradium sambucinum (Bl.) Hartley

(Like Sambucus, Caprifoliaceae)

Gard. Bull.Sing. 34 (1981) 100. Philagonia sambucina Bl. Cat. Pl. Buitenz. (1823) 21; Bijdr. (1825) 250. Euodia sambucina (Bl.) Hook.f.ex Koord. & Val. Med. Lands Plantent. 17 (1896) 216.

Medium to large tree to 34 m tall, branchlets puberulent but glabrate. *Leaves* to 36 cm long; of 3-6 pairs of leaflets; stalks of lateral leaflets to 10 mm long; blades elliptic-oblong to ovate, lanceolate, or oblanceolate, 6-18 cm long, 2-5 cm wide, at base usually somewhat oblique (except in terminal leaflet), with 13-16 pairs of main secondary veins, the margins crenulate distally, the apex acuminate; conspicuously gland-dotted, drying pale green or brownish, usually with appressed pubescence on midrib and main veins. *Inflorescences* to 25 cm long, the axes slightly pubescent, pedicels less than 1.5 mm long. *Flowers* 4-merous, petals yellow-green drying brownish, to 3 mm long, somewhat villous inside. *Fruit* of 4 follicles, each 3-4 mm long and high, free to base or nearly so; endocarp sparsely pubescent; *seeds* 2 per follicle, coherent (like a single one), 1.5-2 mm long.

W. Malaysia, Sumatra, Java, and Sumbawa. In Peninsular Malaysia, known only in Trengganu, G. Andi Mangin (Whitmore FRI 12139).

## Tetradium glabrifolium (Champ. ex Benth.) Hartley

(glabrous leaved)

Gard. Bull. Sing. 34 (1981) 109. Boymia glabrifolia Champ. ex Benth. in Hook. J. Bot. Kew Gard. Misc. 3 (1851) 330. Megabotrya meliaefolia Hance ex Walp. Ann. Bot. Syst. 2 (1852) 259. Evodia meliaefolia (Hance ex Walp.) Benth. Fl. Hongkong (1861) 58. Phellodendron burkillii Steenis, Gard. Bull. Sing. 17 (1960) 357.

Small or medium tree to 20 m tall, branchlets finely pubescent but fully glabrate. Leaves to 38 cm long, with 2-9 (rarely but 1) pairs of leaflets, the blades elliptic to oblong-elliptic, 4-15 cm long, 1.7-6 cm wide, the lateral ones acute to subtruncate at base, usually oblique, the apex acuminate, the margins entire to crenulate, with 8-18 pairs of secondary veins, gland-dots inconspicuous, undersurface whitish or pale green and usually distinctly glaucous; lateral leaflet stalks 3-15 mm long. Inflorescences to 19 cm long, the axes finely pubescent to glabrous, pedicels to 4 mm long. Flowers mostly 5-merous; petals greenish to yellowish or white, to 4 mm long. Fruit usually 5-carpellate, all or only 1-4 carpels maturing as follicles, these puberulent on the sides, 1-seeded. Seed black, subglobose or ovoid, 2.5-4 mm long, usually paired with a smaller aborted seed.

NE India and Sikkim Himalaya to S China and Indochina, N to Japan, Taiwan, S to Peninsular Malaysia, Sumatra, and NE to the Philippines.

In Peninsular Malaysia, known from Kedah (Enggang Forest Reserve,. KEP 78904, type of "Phellodendron burkillii") and Gunung Jerai (Kedah Peak, FRI 021715); recorded as a tree to 16 m (50 ft.) tall with smooth slightly lenticellate bark. Rare.
